2020 A number of widely used
contemporary processors have
instruction-set extensions for
improved performance in multi-

to allow operations to proceed

have been incorporated both in
specialist DSPchips such as the

general purpose CPU chips like
the Intel IA32 (Intel, 2000) or
the AMD K6 (Advanced Micro

instruction-set extensions are
typically based on the Single

which a single instruction
causes the same mathematical
operation to be carried out on
several operands, or pairs of
operands, at the same time.

The level or parallelism
supported ranges from two
floating point operations, at a

processor architectures are

moving towards greater levels
of parallelism, the most widely

structured around a model of
computation in which

operations takeplace on a

appropriate when processors
worked this way, but has

become an impediment to

Genetic programming (GP) is a systematic, domain-independent method for getting computers to solve problems automatically starting from a high-level statement of what needs to be done. Using ideas from natural evolution, GP starts from an ooze of random computer programs, and progressively refines them through processes of mutation and sexual recombination, until high-fitness solutions emerge. All this without the user having to know or specify the form or structure of solutions in advance. GP has generated a plethora of human-competitive results and applications, including novel scientific discoveries and patentable inventions. This unique overview of this exciting technique is written by three of the most active scientists in GP. See
